

PATIENT MEDICAL CHART

CONFIDENTIAL - FICTIONAL RECORD FOR AUTHORIZED SOFTWARE TESTING

1. PATIENT DEMOGRAPHICS

Field	Value
Patient Name	Daniel Robert Hayes
DOB / Age	September 6, 1976 / 49
MRN	HEP-778130
Sex	Male
Address	903 Lake Avenue, Orlando, FL 32801
PCP	Dr. Carla Nguyen, MD

2. INSURANCE & COVERAGE

Field	Value
Payer	Cigna LocalPlus Commercial
Member ID	CIG-63081244
Group	LP-4410
Prior authorization	Required - electrophysiology procedures
Requested service	Transcatheter ventricular ablation

3. ACTIVE PROBLEM LIST

ICD-10	Diagnosis	Status
I49.3	Premature ventricular contractions	Active
I10	Essential hypertension	Active
E78.5	Hyperlipidemia	Active

4. MEDICATIONS

Medication	Dose	Frequency	Indication
Metoprolol succinate	50 mg	Daily	PVC suppression / hypertension
Lisinopril	10 mg	Daily	Hypertension
Atorvastatin	20 mg	Nightly	Hyperlipidemia

5. ALLERGIES

Allergen	Reaction	Severity
None known	-	-

6. ELECTROPHYSIOLOGY CONSULT - MARCH 3, 2026

- PVCs were discovered incidentally during an employment physical. Patient denies palpitations, chest pain, presyncope, syncope, dyspnea, fatigue, or exercise limitation.
- He cycles 60-90 minutes three times weekly without symptoms.
- Metoprolol was started by primary care; patient reports no adverse effects and prefers to continue it.
- No history of sustained ventricular tachycardia or ventricular fibrillation.

Physical examination

Field	Value
BP	126/74
HR	68
SpO2	98% room air
Cardiac	Regular rhythm with occasional ectopy
Functional status	No limitation

Assessment

- Asymptomatic premature ventricular contractions with preserved ventricular function.
- Continue beta blocker and obtain extended ambulatory monitor to quantify PVC burden.

7. 14-DAY AMBULATORY MONITOR - MARCH 10-24, 2026

Measure	Result
Analyzable time	13 days 18 hours
PVC burden	12.4% of total beats
Patient-triggered events	0
Sustained VT	None
Nonsustained VT	One 3-beat run at 118 bpm
Symptom correlation	None; patient remained asymptomatic

8. ECHOCARDIOGRAM - MARCH 28, 2026

Field	Value
LVEF	61%
LV size	Normal
Regional wall motion	Normal
Valves	No significant disease
Impression	Normal structure and systolic function

9. FOLLOW-UP - APRIL 5, 2026

- Patient remains asymptomatic. No palpitations, dizziness, syncope, exercise intolerance, or medication side effects.
- PVC burden reviewed at 12.4%, below 15%. Metoprolol is effective enough for patient preference and is tolerated.
- Options discussed: observation, continued medication, or elective ablation. Patient requests ablation to avoid long-term monitoring even though symptoms are absent.

10. PLANNED PROCEDURE

Field	Value
Procedure	Comprehensive EP study with ventricular arrhythmia ablation
CPT	93654
Indication	Premature ventricular contractions
Requested date	May 20, 2026
PA status	Pending
Electrophysiologist	Dr. Samuel Ortiz, MD

Clinical indication summary

- Adult age 49.
- PVC burden 12.4%.
- PVCs are explicitly asymptomatic.
- Medical therapy is tolerated and has not failed, is not contraindicated, and is preferred by the patient.
- No sustained ventricular arrhythmia.

11. AUTHORIZATION SUBMISSION NOTE

The practice requests elective PVC ablation. The record contains complete monitoring and symptom documentation; there is no missing evidence that would establish either policy pathway.
