

SYNTHETIC PATIENT RECORD - SOFTWARE TESTING ONLY

Patient Medical Chart

Gulf Atlantic Vascular Institute | Vascular Surgery and Neurology | Florida

1. Patient and coverage information

Patient	Thomas Allen Reed	DOB / age	1953-02-11 / 73
Member ID	FLB-SYN-1002	Plan	Florida Blue PPO (synthetic)
Chart ID	GAVI-2026-2287	Encounter	2026-07-02
Clinician	Aaron Feldman, MD	Location	Jacksonville, FL

2. Prior authorization request

Procedure	Right carotid angioplasty and stenting with distal embolic protection	CPT	37215
Diagnosis	Symptomatic right internal carotid artery stenosis	ICD-10	I65.21
Laterality	Right	Requested date	2026-07-20
Authorization	Initial request	Payer	Florida Blue

3. Focal cerebral ischemic event

On 2026-06-15, the patient experienced abrupt left arm weakness and expressive aphasia lasting 18 minutes. Symptoms resolved completely within 24 hours and neurology diagnosed a right-carotid-territory transient ischemic attack. There is no residual disability.

The event occurred 35 days before the proposed procedure and is documented as focal cerebral ischemia rather than nonspecific dizziness or syncope.

4. Vascular imaging

Study	Result	Clinical interpretation
CTA neck - 2026-06-16	78% stenosis of proximal right internal carotid artery by NASCET	Within 50% to 99% range
Duplex - 2026-06-18	PSV 286 cm/s; EDV 108 cm/s	Confirms severe right ICA stenosis
Brain MRI - 2026-06-16	No acute infarct or hemorrhage	TIA; no disabling stroke

5. Carotid endarterectomy suitability

The lesion is surgically accessible. The patient has no prior neck radiotherapy, no prior neck surgery, no tracheostomy, normal cervical mobility, and no high cervical or otherwise inaccessible lesion.

Vascular surgery explicitly documents that there is no anatomic contraindication to carotid endarterectomy. He is a suitable candidate for standard carotid endarterectomy, which was offered as the preferred treatment.

The patient prefers a less invasive approach and requested carotid stenting. Patient preference does not create an anatomic contraindication to carotid endarterectomy.

6. Medical therapy and authorization rationale

Current therapy includes aspirin 81 mg daily, clopidogrel 75 mg daily, atorvastatin 80 mg nightly, and blood-pressure control. There is no carotid artery dissection.

Plan submitted for authorization: carotid angioplasty with stent placement and distal embolic protection. The record intentionally documents that the required anatomic contraindication to carotid endarterectomy is absent.

Attestation: This is a wholly fictional record created for software regression testing. It must not be used for clinical care, billing, or coverage determination.
